

Review of generating unit risk when connected in groups

Response to Industry Feedback, June 2025

Two submissions were received in response to Transpower seeking industry feedback on the Review of generating unit risk when connected in groups document.

There was general agreement and support for Transpower's new approach to generating unit risk when connected in groups.

In response to comments received, Transpower wishes to advise that to improve clarity and support industry understanding, we've expanded the detail in Example C on page 9. This provides further guidance on how groups of generating units are assessed under different protection scheme configurations.

Based on the feedback received, the final version of the document will be published with the minor update described above.

We thank all participants for their feedback.
